

IEM Industries, with 60 years of manufacturing experience, renews its commitment to the Global Environment

The Mexico GHG Program is a national voluntary accounting and reporting program of greenhouse gases (GHGs) and the generation of emission-reduction projects. The program comes from private initiative as a response from the industry to take voluntary actions to combat climate change.

Under the affirmation of "what is not measured is not controlled," the program focuses on developing the technical capability to quantify gas emissions GHGs. Knowing the concentrations and sources of GHG emission of gases, it is possible to identify areas of opportunity to reduce these emissions and develop reduction projects.

IEM Industries, with 60 years of manufacturing experience, renews its commitment to the Global Environment by becoming the first company of Grupo Condumex to participate in the Mexico GHG Program. The program aims to provide support to companies interested in contributing to the care of the environment and the mitigation of climate change through support, training and technical assistance.

IEM remains at the forefront in its responsibility to the environment and continues to focus on finding solutions to minimize the environmental impact of our manufacturing operations.
